# CS 49 Section

Week 5

Surajit A Bose

### Agenda

+ 3

- Logistics and check-ins
- Review of lecture concepts
  - Expressions
  - Constants
  - The **random** module and **math** library
- Coding Template
- Section Problem: <u>Mars Weight</u>

### Section Survey

+ 3

- Please take the brief, anonymous <u>Section Survey!</u>
- Two required multiple choice questions
- Two optional open-ended questions
- Will take about one minute
- Will help me make section more useful for you
- Not the same as the mid-course survey (which is for the entire class)
- Section survey URL: <a href="https://forms.gle/p4Qjd5235H2359vQ9">https://forms.gle/p4Qjd5235H2359vQ9</a>
- Deadline: 11a Friday, February 14

### No meeting February 14

- Due to the Presidents' Day holiday, there will be no section next Friday
- Section slides and solutions for week 6 will be posted early next week
  - CiP solutions may not be available until Friday
- Feel free to reach out via Pronto or Canvas inbox with any questions regarding the week's material or assignments
- Enjoy your Valentine's Day!

### Quick Check-in

+ 4

Let's quickly go round the room! Pick any one of the following to complete the sentence: As the weeks go by, this class is getting:

- easier, because ...
- more difficult, because ....
- more fun, because ...
- more stressful, because ...

### How to get hold of me / get help+

- The <u>class forum</u>. Feel free not only to ask, but also to answer questions!
- Surajit's office hours:
  - Fridays 12 noon–1p, directly after section
  - By appointment on <u>Zoom</u>
- Lane's office hours
- Canvas inbox or Pronto inbox for Lane
- Canvas inbox (preferred) or Pronto for Surajit
- Sina's support section, Fridays 1p-2p on Zoom (note the changed time)
- Email <u>bosesurajit@fhda.edu</u>, 24 hr turnaround
- Online or in-person tutoring via the STEM center (Room 4213)
- The section <u>GitHub repo</u> has lecture and section slides and solutions

# my + 2 - 1 + C

Lecture Review: Expressions

- A statement that can be evaluated
- We've seen boolean expressions in Karel: front\_is\_clear(),
   beepers\_present(), that evaluate to True or False
- There are also arithmetic expressions: given x = 9 and y = 2,

```
\# 7 = 11
\circ z = x + y
\circ z = x - y
                          # z = 7
\circ z = x * v
                          \# z = 18
\circ z = x / y
                       # z = 4.5
\circ z = x // y
                      # z = 4
\circ z = x % y
                       \# z = 1
\circ z = x ** y
                          \# z = 81
                          \# z = -2
\circ z = -y
```

- The symbols +, -, /, etc. are the operators
- The terms operated upon ( $\mathbf{x}$  and  $\mathbf{y}$  in the previous slide) are the operands
- The evaluated result of the expression is typically stored in a variable (**z** in the previous slide) using the assignment operator =
- Keep in mind the difference between the two division operators:
  - / will always result in a float
  - o // will always result in an integer, any remainder being discarded
  - % is the modulus operator for the remainder of integer division
- Given x = 8 and y = 2, what is the value and type of these expressions?

- The symbols +, -, /, etc. are the operators
- The terms operated upon ( $\mathbf{x}$  and  $\mathbf{y}$  in the previous slide) are the operands
- The evaluated result of the expression is typically stored in a variable (**z** in the previous slide) using the assignment operator =
- Keep in mind the difference between the two division operators:
  - / will always result in a float
  - o // will always result in an integer, any remainder being discarded
  - o % is the modulus operator for the remainder of integer division
- Given x = 8 and y = 2, what is the value and type of these expressions?

+ 4

Watch out for floating point values! They are not stored precisely:

- Precision of float results is not reliable beyond the precision determinable by the inputs. Here, the value of z is not reliable past one decimal place.
- Can use **round(a, b)** where **a** is the value to round, **b** the number of decimal places:

```
print(round(z, 1)) # 0.9
```

+ 3

Operators have the following precedence:

```
( ) parentheses
** exponentiation
- unary negation
*, /, //, % multiplication, division, integer division, modulus
+, - addition, subtraction
```

• Operators with the same precedence (e.g., multiplication, division) are evaluated from left to right

- + 32
- Compound operators: +=, -=, \*=, etc. combine the arithmetic and assignment operators in a single command
- Given initial values x = 3 and y = 2, what would the following expressions evaluate to?

```
\circ x *= y # x = x * y
```

$$\circ$$
 x += 4 # x = x + 4

$$\circ$$
 x /= y # x = x / y

$$\circ$$
 x %= y # x = x % y

- + 32
- Compound operators: +=, -=, \*=, etc. combine the arithmetic and assignment operators in a single command
- Given initial values x = 3 and y = 2, what would the following expressions sequentially evaluate to?

$$x *= y # x = x * y, x = 6$$

$$\circ$$
 x += 4 # x = x + 4, x = 10

$$\circ$$
 x /= y # x = x / y, x = 5.0

$$\circ$$
 x %= y # x = x % y, x = 1.0

- Notice that the types of the results depend variously on the operands, the operators, or the results themselves
- Remember that types can be cast to a different type

Lecture Review: Constants

### Constants

+ 42

- In Python, a constant is a variable whose value does not change during the execution of the program
- By convention, constants are named in UPPER\_SNAKE\_CASE
- Why use constants?
  - To avoid "magic numbers"
  - To allow easy updates
  - To follow the principle of programming for the general case
- Unlike most other programming languages, Python does not enforce constants; they are a convention

### **Constants**

- Suppose I have a program that calculates various resources needed for running an office building based on its square footage. E.g., how many smoke detectors it needs, what the budget should be for HVAC, etc.
- What constants would I need so I can reuse the program for any building?

### **Constants**

+ 4

- Suppose I have a program that calculates various resources needed for running an office building based on its square footage. E.g., how many smoke detectors it needs, what the budget should be for HVAC, etc.
- What constants would I need so I can reuse the program for any building?
  - SMOKE\_DETECTOR\_FACTOR
    # e.g. 1 per 2000 sq.ft. or 0.0005
  - o HVAC\_FACTOR
    # how many dollars to budget per sq.ft.

 $\frac{1}{2}$ 

Lecture Review: random and math

### The random module and math library

- A module is a python file (with the extension .py) that contains code that can be reused in a different program.
- The random module allows generation of pseudo-random numbers
- A library, loosely speaking, is a collection of many modules
- The math library allows mathematical operations such as calculating square roots
- To use such external modules or libraries, your program needs an import statement such as import math or import random
- We've seen such a statement: from karel.stanfordkarel import \*

### The random module and math library

```
from math import sqrt
import random
def main():
    for i in range(4):
        my num = random.randint(200, 1000)
        my sqrt = sqrt(my num)
        print(f'Number is: {my_num}, square root is: {my_sqrt}')
if __name__ == '__main__':
    main()
```

### The random module and math library

```
from random import randint
import math
def main():
    for i in range(4):
        my num = randint(200, 1000)
        my sqrt = math.sqrt(my num)
        print(f'Number is: {my_num}, square root is: {my_sqrt}')
if __name__ == '__main__':
    main()
```

### Flashback to Week 1 ...

### The Anatomy of a Program

77

- File name, comment, your name, date
- Import statement
- main() module with further comments. Indentation is important!
- Guard clause and invocation of main()

```
main.py
Karel moves a beeper from the bottom row to the top row
Programmer: Surajit A Bose, Date: 2025.02.03
from karel.stanfordkarel import *
def main():
    """Move Karel and beeper to top row
    Preconditions:
    - Karel is in the bottom left corner, facing east
    - There is a beeper immediately in front of Karel
    Postconditions:
    - Karel is in the top right corner, facing east
    - Beeper has been moved and is immediately behind Karel
         # Delete this line and write your code here! :)
# There is no need to edit code beyond this point
if name == ' main ':
    main()
```

### The structure of a Python program

4

- Python programs have a typical order.
  - Comment with filename, program overview, and programmer name
  - import statements
  - constants
  - o main() function
  - helper functions
  - guard clause and invocation of main()
- A template for your use is <u>here</u>

## Section problem: Mars Weights

https://codeinplace.stanford.edu/cs49-w24/ide/a/marsweight

### Mars Weights

+ 4

Due to the weaker gravity on Mars, an Earthling's weight on Mars is 37.8% of their weight on Earth. Write a Python program that prompts an Earthling to enter their weight on Earth and prints their calculated weight on Mars. The output should be rounded to two decimal places when necessary. Example:

Enter a weight on Earth: 120
The equivalent weight on Mars: 45.36

- What constant should we use?
- As what type should the input from the user be cast?

Let's get to work!

# That's all, folks!

Next up: Control Flow!
